RESEARCH INTERESTS

I study **spatial intelligence for physical agents**: how to build a coherent understanding of the physical world that supports reliable action in unfamiliar environments. My work develops the perceptual and predictive foundations for this goal, from recovering and retaining spatial evidence to imagining physically plausible futures that guide actions and support pre-execution consistency checks. I am now interested in extending these foundations toward **agent–world model co-evolution**, where agents gather informative experience to improve world models, while improved models support long-horizon planning and action evaluation.
